Observation - Week 01

Topic: HTML5 and CSS3

Name: _____ Roll No: _____ Date: _____

Aim

To design a responsive ExpenseWise landing page and expense-entry form using semantic HTML5, CSS3 and Flexbox.

Concepts Covered

- Semantic elements: header, nav, main, section, article, footer
- Forms, input types and built-in validation (required, min, maxlength)
- CSS selectors, custom properties (variables) and the box model
- Flexbox layout: header bar and wrapping card row

Observations

- Semantic tags give the page structure that screen readers and search engines understand.
- type="number" with min and step blocks invalid amounts before the form is submitted.
- flex: 1 1 220px with flex-wrap lets the cards stack on narrow screens without media queries.
- CSS variables (:root) keep the brand colours in one place.

Viva Questions

1 What is the difference between div and section?

2 Explain the CSS box model.

3 Difference between Flexbox and Grid?

4 What does the viewport meta tag do?
