Observation - Week 02

Topic: JavaScript ES6 and DOM

Name: _____ Roll No: _____ Date: _____

Aim

To build an expense manager using ES6 features, DOM manipulation and the Fetch API with async/await.

Concepts Covered

- let / const, arrow functions, template literals, destructuring
- Array methods: forEach, filter, reduce
- DOM selection, creation and event listeners
- Promises, async/await and the Fetch API with error handling

Observations

- reduce() computes the running total in one pass over the expense array.
- Re-rendering the list from one array (single source of truth) avoids the DOM and the data going out of sync.
- fetch() only rejects on network errors, so res.ok must be checked for HTTP errors.
- try / catch around await keeps the page usable when the request fails.

Viva Questions

1 Difference between var, let and const?

2 What is a Promise?

3 What is event bubbling?

4 Why do we check res.ok after fetch?
