Observation - Week 05

Topic: Full Stack Integration (MERN)

Name: _____ Roll No: _____ Date: _____

Aim

To integrate a React frontend with an Express and MongoDB backend and build the complete ExpenseWise application.

Concepts Covered

- Project structure: client and server folders
- REST API consumed from React with fetch
- CORS and environment variables (dotenv)
- React state and effects (useState, useEffect)

Observations

- cors() must be enabled on the server because the client runs on a different port.
- Secrets such as the database URI stay in .env, which is excluded by .gitignore.
- The client reloads the list after every change so the UI always matches the database.
- The browser Network tab shows each API call with its status code and response.

Viva Questions

1 What is CORS?

2 What is the MERN stack?

3 Why use environment variables?

4 What does useEffect do?
